

* ω_p $f = f_0$ geldt:

$$E = \frac{1}{2} m v_0^2 + \frac{1}{2} m v^2$$

m : massa frey
 m : " vieren

index "0" \rightarrow voor de verhoging
 " " \rightarrow by slakstand

$v \cdot r = v$ en $v = v_0$ (Contrahssmedheid wies)

$$E = \frac{1}{2} m v_0^2 + \frac{1}{2} m v^2 \quad (1)$$

* Hydens verhoging:

$$\left. \begin{array}{l} \rightarrow F_{rem} \\ \rightarrow F_{coll} \\ \rightarrow F_{beding} \\ \rightarrow F_{verhoging} \end{array} \right\} (2)$$

* (1) en (2) \Rightarrow

$$(M_{tm}) \frac{v_0^2}{2} = DS (F_{rem} + F_{coll} + F_{beding} + F_{verhoging})$$

* Invloed vd. helling (4)

→ helling van $x\%$

$$G = \text{constante}$$

$$N = \frac{G}{\cos \alpha}$$

$$F_{\text{helling}} = G \cdot \sin \alpha$$

$$= m \cdot g \cdot \sin \alpha$$

$$\approx G \cdot \tan \alpha = G \cdot \frac{x}{100}$$

$$\nabla_0 = -m \cdot g \cdot \sin \alpha$$

Wanneer de helling wordt afgereden

* Invloed v.d. remkracht (1)

$$F_{\text{rem}} \leq \mu \cdot G$$

maximale vertraging indien $F_{\text{rem}} = \mu \cdot G$

$$\text{dan: } \mu \cdot G = m \cdot a$$

$$\mu \cdot m \cdot 9,81 = m \cdot a$$

$$a = 9,81 \cdot \mu$$

$$\text{met } \mu = 0,25$$

$$\approx 2,5 \text{ m/s}^2$$

\Rightarrow Vertragingen $< 2,5 \text{ m/s}^2$ zijn mogelijk

! $G \rightarrow$ enkel de massa op de geremde wielen

* Invloeding vd. wrijving (3)

$$F_{\text{wrijving}} = f_r \cdot G \quad \text{met } f_r = \text{rolweerstandscoefficiënt}$$

Te verwaarlozen?

* Invloed vd. lucht (2)

$$F_{\text{lucht}} = \frac{1}{2} \int (v + v_{\text{wind}})^2 \cdot \rho_v \cdot A$$

...
